ALDAVER

Spine Endoscopy Simulator

Endoscopic spine surgery procedure training

ALDAVER

Spinal Endoscopy Simulator

Introduction

Minimally invasive spine surgery is increasingly performed due to reduced tissue damage and faster recovery times. As spinal endoscopy continues to expand across neurosurgery and orthopedic surgery, there is a growing need for realistic training models capable of replicating both anatomical structures and procedural environments.

ALDAVER's spinal endoscopy simulator is developed using patented tissue-mimicking materials and advanced 3D architecture to accurately reproduce vertebrae, intervertebral discs, ligamentum flavum, and the spinal canal. The simulator supports realistic bone drilling, haptic feedback, irrigation conditions, and compatibility with X-ray and CT imaging systems, enabling highly immersive training for spinal endoscopy procedures.

Spinal Endoscopy Simulator

[Replaceable Internal Kit]

[Assembled Spinal Endoscopy Simulator]

Model Features

1. Anatomically accurate spinal model with realistic bone drilling functionality
2. Lifelike mechanical properties and haptic feedback (Ligaments, Spinal Cord, Discs, etc.)
3. Compatible with CT and X-ray imaging systems
4. Realistic bone bleeding effects
5. Implementation of an integrated irrigation system

ALDAVER

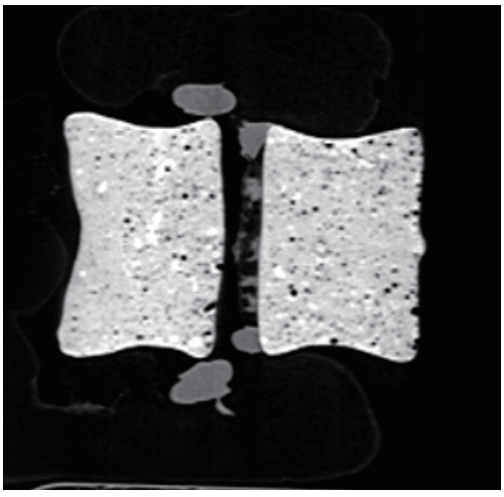

Technical Characteristics

1 Anatomical & Imaging Fidelity

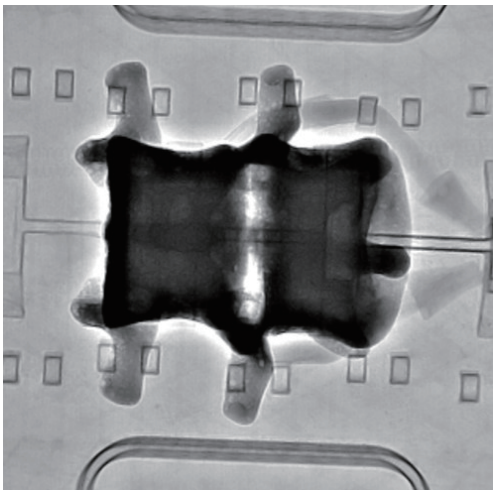

Anatomically Replicated Structures

High-fidelity anatomical replication of the spine, including vertebrae, interspinous ligaments, ligamentum flavum, the spinal canal, and discs.
